

LAB OBSERVATION

EXPERIMENT-14

Create a program in python to check for agreement in sentences based on a context-free grammar's rules.

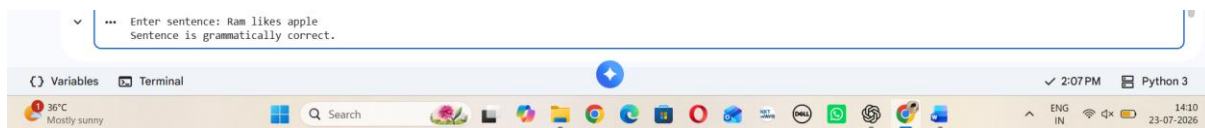

CODE:

```
[4] ✓ 13s
1 subject = ["Ram", "John"]
2 verb = ["likes", "sees"]
3 object = ["apple", "ball"]
4
5 sentence = input("Enter sentence: ").split()
6
7 if len(sentence) == 3 and sentence[0] in subject and sentence[1] in verb and sentence[2] in object:
8     print("Sentence is grammatically correct.")
9 else:
10    print("Sentence is grammatically incorrect.")
```

The screenshot shows a Python IDE with a code editor and a terminal. The code defines lists for subjects, verbs, and objects, then checks if a user-entered sentence (split into words) matches the structure of a subject-verb-object sentence. The terminal shows the input "Enter sentence: Ram likes apple" and the output "Sentence is grammatically correct."

OUTPUT:

```
... Enter sentence: Ram likes apple
Sentence is grammatically correct.
```

The screenshot shows the terminal output of the program. The user enters "Enter sentence: Ram likes apple" and the program outputs "Sentence is grammatically correct."
